When a cell divides, nuclear chromatin (DNA and surrounding protein) condenses into chromosomes that are easily visible under a microscope. For a deeper understanding' of genetics, genetics, our website, GeneTics Alive! Nucleol: The prominent structure in the nucleolus is the nucleolus. The nucleolus produces ribosomes, which move from the nucleus and take up position on the crude endoplasmic lattice where they are critical in protein synthesis. Cytosol: Cytosol is the "soup" in which all other cellular organelles reside and where most cellular metabolism takes place. Although mostly water, the cytosol is packed with proteins that control cellular metabolism, including signal transduction pathways, glycolysis, intracellular receptors and transcription factors. Cytoplasm: This is a collective term for the cytosol plus the organelles suspended inside the cytosol. Centrosome: The microtubule organizational center (MTOC) is an area of the cell where microtubules are produced. Plant and animal cell centrosomes play a similar role in cell division, and both include collections of microtubules, but the plant cell centrosome is simpler and does not have centrioles. During the division of animal cells, the centrioles replicate (create new copies) and the centrosomes divide. The result is two centrosomes, each with its own pair of centrioles. The two centrosomes move to opposite ends of the nucleus, and from each centrosome, the microtubules grow into a "fuse" which is responsible for separating the replicated chromosomes in the two daughter cells. Centriol (animal cells only): Each centriol is a ring of nine groups of fused microtubules. Each group contains three microtubules. Microtubules (and centrioles) are part of the cytoskeleton. In the complete centrosome of the animal cell, the two centrioles are arranged so that one is perpendicular to the other. Golgi: The Golgi apparatus is a membrane structure with a single membrane. It is actually a pile of membrane-bound vesicles that are important in packing macromolecules for transport elsewhere cell. The stack of larger Á vesicles is surrounded by several smaller vesicles containing those oissatop .)+aN(oidos emoc inoi id etallortnoc aticsuálled e ossergniálled ilibasnopser itrop i emoc –Àsoc ,inomro ilg e iropas i .irodo ilg rep irrottecer i onodulcni eniotorp etseuQ .eralullec Átívittaál rep ilatnemadnof eniotorp esoremun id azneserp allad asselpmoc 'Àip aser "À anarbmem aL .auqcaálled otallortnocni ossulf la avittetorp areirrab anu emoc ecsiga eralullec anarbmem al iuc rep ,jauqcaálled aruap al' »Àehcibofordi«À onos idipilofsaf ied etsocsan edoc el .aivattuT .alullec alled onretnesaílla eis losotic led onretnííalla ais auqcaál noc ilibitapmoc onos ehc osmes len ,jauqcaálled etnama(»Àeifordi«À onos otarts oippod led etsopse etset eL .Jocidipil otartsih' idipilofsaf id otarts oippod nu .anarbmem anu ni asuiccar "À alullec ingQ .eralullecC anarbmeM ,oicsalir li rep eralullec eioifrepus allus etatropsart itop onognev eiroterces elociscev eL .igloG otarappaálled eioifrepes elociscev ni etanoizefnoc onos à irotittemartoruen ,inomro .se da à iralullec inoizerces eL .airoterces aloicisceV .onegisso e auqca ni onegordi id odissorep li onognopmocs imosissorep len ivitadisso imizne ilG .irettab i erediecu rep onegordi id odissorep onocudorp ihcnaib ilubolg i ,oipmese dá .ocissot onegordi id onozudorp airporp allad alullec al onoggetorp imosissorep i .ilamina elullec elleN .enoizarserotof allen itsalporote ied aznetsissaál e orehcuz ni issarg idica ilged enoisrevnoc al iuc art flour id eires anu onoglovs imosissorep i .ilategev elullec elleN .ivitadisso imizne ilged itagel-anarbmem ittehccep onos imosissorep I .imosissoreP .oloucav len osseps 'Àip onavort is ilategev elullec elled icitilordi imizne ilG .ilategev elullec elen irar am .ilamina elullec elen inumoc onoS .eralullecartni enoitsegid al rep irassecen icitilordi imizne onognetnoc imososi I :amososiL .igloG otarappaálled airefrep alla anarbmem alla etagel elociscev ni itanoizefnoc onos eiroterces elociscev elled e imosissorep ied .imososil ied ilanomro o icitamizne itunetnoc I .elocelomorcam calcium (Ca++) and chloride (Cl-). Mitochondria: Mitochondria provide energy a cell needs to move, divide, produce secretory products, contract à in short, they are the cell's centers of power. They about the dimensions of the bacteria, but may have different shapes depending on the type of cell. The mitochondria are staff linked to the membrane and, like the nucleus, have a double membrane. The external membrane is quite smooth. But the internal membrane is highly twisted, forming folds (crystae) when seen in the transversal section. The crystaes significantly increase the surface of the internal membrane. It is on these crystaes that food (sugar) is combined with oxygen to produce ATP - the primary energy source for the cell. Empty: a vacuole is a membrane bag that plays a role in intracellular digestion and in the release of cellular waste products. In animal cells, vacuoles are generally small. The voids tend to be large in plant cells and perform different roles: store nutrients and waste products, helping to increase the size of the cells during growth, and also acting a lot like lysosomes of animal cells. The vacuole of plant cells also regulates the pressure of turgor in the cell. The water is gathered in cellular vacuoles, pressing outwards against the cell wall and producing rigidities in the plant. Without sufficient water, the pressure of the turgor descends and the plant is wilted. Cell wall (only plant cells): plant cells have a rigid and protective cell wall consisting of polysaccharides. In higher plant cells, polysaccharide is usually cellulose. The cell wall provides and maintains the shape of these cells and acts as a protective barrier. The liquid is collected in the vacuole of plant cells and pushes towards the cell wall. This turgor pressure is responsible for the crunchiness of fresh vegetables. Chloroplast (only plant cells): chloroplasts are specialized organels present in all higher plant cells. These organels contain the chlorophyll of the responsible plant cell irtla irtla onos ic amorts olled onretn'illa .anretnesaíllabmem aippod anu onnah itsalporolc I .isetnisotof id ocimihcoib ossecorp li etnaidem ilibazzilobatem irehcuz ni acirefsomta acinobrac eírdina 'Àip auqca eritrevnoc rep atazzilitu eneiv aigrene atseuQ .eralos ecul allad aigrene' eribrossa id Áticapac alled e atnaip alled edrev eroloc etaidemretni Jstnemaliforcim' stnemalif nitca selubutorcim :stnemalif nietorp yramirp eerht fo krowten dezinagro na si noteleksotyc ehT .noteleksotyc eht tuohitiv ecalp ekat ton dluoc noitcartnoc rebif elcsum dna noitomocol lec sa llew sa ,sellenagro llec fo tmevemo lanretni ehT .ytilitom llec ni si noteleksotyc eht fo ecnatropmi yramirp eht tuB .ephals llec niatniam ot spleh noteleksotyc eht .seilpmi eman sti sA .noteleksotyC .niahc nietorp gninehtgnel eht ot selucelom dica onima laudividni sdda ANR refsart erehv emosobir eht gnola yllacitametsys devom si suelcun llec eht morf ANR regnesseM .tinubus llams a dna tinubus egral a .strap owt sesirpmoc emosobir hcaE .sisehtnys nietorp fo etis eht era yeHT .sillec citoyrakue dna citoyrakorp htob ni elor laicurc a yalp taht nietorp dna ANR fo stekcap era semosobir :semosobir .llec eht tuohguorht tropsnart rof muluciter cimsalpodne eht ni tcelloc semosobir eseht no dezisehtnys snietorP .ecafrus sti no semosobir suoremun fo ecneserp eht ot eud ypoosorcim norctoele yb *delbbeP' sraepa muluciter cimsalpodne hguoR :muluciteR cimsalpodnE hguoR .noitcartnoc llec elcsum ni esaeíer muiclac fo lortnoc dna .sillec revil ni snixot eilulos-dipil fo nwođkaerb .sisehtnys enomroh diorets dna dipil gniđulcni epyt llec cifceps eht no gniđneped snoitcnuf tñereffid syalp RE htoomS .ypoosorcim norctoele yb htooms sraepa ti esuaceb deman os si muluciter cimsalpodne htooms eht llec citoyrakue eht fo ytiselpmoc eht tseguis snoitcnuf deirav sti dna enarbmem raelcun retuo eht fo noitauntnoc a si RE ehT .trohs rof RE ro .muluciter cimsalpodne eht dellac selubut dna selcisev dnuob-enarbmem fo krowten tsav a si .stcudorp yroterces rehto dna senomroh fo noitcudorp eht rof elbisnopser esohť yllaicepse .illec citoyrakue eht tuohguorht' .muluciteR cimsalpodnE htoomS .sisehtnysotobp no noitamrofni fo ecruos doog a sedivorp egelloC ytinummoC niatmuoM allertse .jmunarg = ralugnisi "anarg" dellac skcats ni raepa sdiokalyhT' .sdiokalyht eht - serutcurts
